

Approved T5 Data Center Campus FAQ's

This document may be updated as needed

NOTE: UNFORTUNATELY DUE TO NOTICE OF IMPENDING LITIGATION, AND UPON ADVICE OF COUNSEL, THE VILLAGE CANNOT AT THIS TIME OFFER FURTHER RESPONSES TO QUESTIONS REGARDING THE APPROVED DATA CENTER DEVELOPMENT.

About the campus:

➤ **Has the Village approved the development of a data center campus near Peterson Road?**

Yes, T5, an Atlanta, Georgia based data center development/management company has received Village authorization to develop a data center campus along Peterson Road between Alleghany Road and Route 83.

➤ **How big is the approved data center campus?**

The approved campus covers up to 472 acres and can include no more than 10,100,000 square feet of data center space in several individual buildings.

➤ **When did the approval occur?**

The approval of the data center campus was completed over an almost eight-month period between 9/23/2024 and 5/6/2025. The approval occurred after a number of public hearings and public Village Board meetings during that period.

➤ **Will the planned campus need any further approvals?**

The campus has all the needed zoning and site development approvals. When the developer applies for building permits for the buildings or electrical infrastructure, normal building permits will be required, and all applicable building code requirements will need to be met.

➤ **What will the data centers look like?**

The developmental agreements require specific architectural designs. The data center building will look similar to normal office buildings. The Village's adopted landscaping, signage, lighting, and other requirements will apply.

➤ **As part of these approvals are there any other arrangements with data center developer?**

No, the Village's development agreements are the only arrangements the Village has with T5.

➤ **Has the Village agreed to any financial incentives for the approved data center campus?**

No, while it is not unusual for financial incentives to be provided in other places for data centers, the approved development agreements do not provide for any financial incentives.

➤ **Will the approved data center campus create significant truck and other traffic?**

Data centers are low traffic generators due to the type of operation. After construction, the data center campus will generate less traffic than conventional development of the campus properties.

Jobs

➤ **What is the estimated number of jobs that the approved data center campus may create?**

Because operations and technologies will change over time, current estimations of job creation from the data center campus may change. If all 10 million sq ft of approved data center space is built it is currently estimated that 50 permanent jobs are created for every 300,000 sq ft. or 1,680 permanent jobs. This estimate does not include the jobs created from the site development and construction process.

Property Tax Information

➤ **What taxing districts are the approved data center campus buildings in?**

The boundaries of local taxing districts in Illinois do not often match the village boundaries. Villages have no say in determining the boundaries of other independent taxing districts. All or parts of the data center campus are in the following taxing district:

- Village of Grayslake
- Grayslake Community High School District 127
- Grayslake Fire Protection District
- Grayslake Park District
- Round Lake Area Park District
- Freemont Elementary School District 79
- Mundelein High School District 120
- Freemont Library District

➤ **What is the potential property tax benefit from the approved data center campus?**

Development of the data center campus will add significantly to the local tax base. Like all buildings built in the applicable taxing districts, the data center campus buildings will pay property taxes. Ultimately the financial benefits of the campus development will be determined by the independent government taxing districts. Any property tax revenues received by the applicable districts represent financial resources to each district not coming from homeowners. Current

Updated as of June 5, 2026

estimates are that these buildings will be of high construction value and therefore may generate significant property tax dollars to the applicable taxing districts. Ultimately, each applicable independent taxing district determines the property tax impact for their property taxpayers from new buildings.

➤ **What are the potential property tax benefits to Grayslake residents from the approved data center campus?**

Since the approved data center campus is in the Village of Grayslake, Grayslake Community Park District, Grayslake Fire Protection District, and Grayslake Community High School District 127, these buildings will provide additional property tax dollars to these districts not coming from homeowners. Decisions by the independent government taxing districts will determine the amount and type of benefits.

Water Use:

➤ **Will the approved T5 data center campus use an extraordinary amount of water?**

No. The approved T5 Data Center Campus will use less water per day than typical non-residential development of the campus land. Unlike earlier versions of data centers that relied on heavy water use for technology/equipment cooling, these data centers will use primarily air cooling technology with minimal water usage.

➤ **How much water will the approved T5 data center campus use?**

The current water use estimates for the up to 10 million sq ft of approved data center space is no more than 50 thousand gallons per day. These 50 thousand gallons per day represent just 4.0% additional water use over what the Village supplies each day. This extra use has no impact and can easily be accommodated within the Village's water supply system.

Electricity Usage:

➤ **Will the approved T5 data center campus use significant amounts of power?**

These data centers are needed digital infrastructure our society relies on for cloud computing, artificial intelligence, and more. This includes the day-to-day data management needs of individuals, business, schools, and institutions, to meet the demands from consumer and business data management and the expected increase in data consumption. Data centers will be built in our region. Like all data centers previously developed and those that will be developed in the future, a significant amount of power will be required.

➤ **Where will the required electricity supply for the approved data center campus come from?**

Like all users of electricity, the T5 data centers will pay for all electricity used on the campus, as per State of Illinois electric rate standards and as provided for in electric supply agreements that

Updated as of June 5, 2026

are already in place between T5 and ComEd. Like all users, the data center campus users will purchase their own power from power suppliers in the nation. This power is bought through a private sector competitive process. The power purchased will be distributed to them by ComEd from national and regional electricity suppliers.

➤ **Who will pay for the infrastructure needed to supply electricity to the approved data center campus?**

Under agreements with ComEd, the data center developer will fund the electricity supply infrastructure to serve the data center campus including its own electrical substation on the campus. The Village of Grayslake will pay nothing for this infrastructure.

➤ **Will the approved T5 data center campus directly increase local residential rates?**

No. In Illinois, state regulations have a separate rate class for high electricity users like data centers, so that the demands of these users do not directly affect residential rates. According to ComEd the cost of utility infrastructure upgrades for large scale projects – like data centers - are largely contained to the business customer category (rate class) made up of other similarly sized large customers and not including residential customers. All ComEd rates and charges are regulated by the ICC and represent ComEd's costs of operating the grid. This is in addition to the energy purchase costs from the suppliers to the data center.

Emissions

➤ **Are there extraordinary air emissions from the approved data center campus?**

No, emissions from the data center campus, once developed, will be similar to emissions that would come from conventional development of that site.

➤ **Are there extraordinary off-site noise impacts from the approved data center campus?**

No, it is estimated that noise from existing roadways and other business developments in the area have greater existing noise effects than any off-site noise impacts from the data center.

Lighting

➤ **Are there extraordinary off-site light impacts from the approved data center campus?**

No, there will be no extraordinary light for this type of development. The Village has added lighting limitations that are more restrictive than most area communities. The campus will be similar to an office park, with much less lighted parking areas. The campus will be required to meet the Village's adopted outdoor lighting restrictions. These rules limit on site lighting amounts, restrict off-site light spill and control night sky impacts.
